#### DIVISION OF HEALTH

This report is the final tabulation of statistical data for the year 1960. The annual report of the Bureau of Vital Statistics is compiled for use in the study of birth, death, marriage, and divorce statistics. This report contains a number of graphic presentations with descriptive material relating to each graph.

If further statistical information is desired, such as more detailed breakdowns of the information contained in the report or copies of the enclosed charts or graphs, one may obtain such information by contacting the Missouri Division of Health.

#### LIVE BIRTH AND DEATH RATES: MISSOURI

The graph below shows the trend in the birth and death rates from 1910 to date. During this period, the death rate has declined from approximately 13 per 1,000 population to the present rate of 11.0 per 1,000 population. During the same period, the birth rate went through a cycle; and although it hasn't reached the level at which it was estimated to be before 1900, it is above the 1910 level. The decline in the births that occurred from 1910 to 1935 has a direct influence on the number of mothers of childbearing age who have been having children during the last five years. This fact is of interest in the problems relating to population expansion. Expansion may take place more rapidly during the next 20 years since the number of mothers who were born since 1935 has been continually increasing. This fact assumes that the birth rate will remain the same.

Live Birth and Death Rates

	Birth	Death		Birth	Death
Year 1	Rate	Rate	Year <u>l</u>	Rate	Rate
1911	22.3	13.1	1936	14.7	12.8

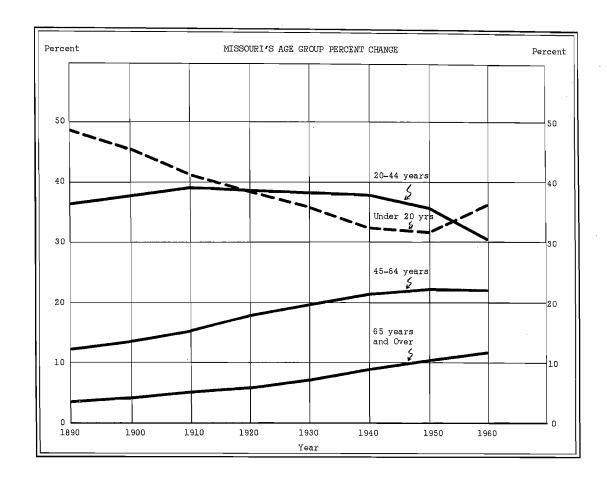

FIGURE 2

MISSOURI POPULATION CHANGE FROM 1950-1960 BY AGE GROUPS AND SEX

#### POPULATION BY AGE GROUPS: MISSOURI

This graph is of interest as it relates to our present day problems concerning the age distribution of the population. From it, one may observe that the percent of persons over 65 years of age has risen from 3 percent in 1890 to 12 percent in 1960. During the same period, the percent of persons 45 through 64 years of age has increased at about the same rate, while the number of persons under 20 has decreased from 48 percent in 1890 to 36 percent in 1960. However, during the last ten years, the age group under 20 experienced a sharp rise in the percent of the total due to the increased birth rate.

Population of Missouri by Age Groups

			Population			Percen	tage Dist	ribution	
Year	All Ages	Under 20	20-44	45-64	65+	Under 20	20-44	45-64	65+

#### TRENDS IN MATERNAL DEATH RATES BY COLOR: MISSOURI

The maternal death rate depicts the decline in the risks relating to childbirth. By separating the white and nonwhite rates, one can observe the peaking in the nonwhite rate which could be due to random fluctuation or to possible sporadic changes in the health conditions which, for some reason, affected the nonwhite population more than the white population.

Trends in Maternal Death Rates1/

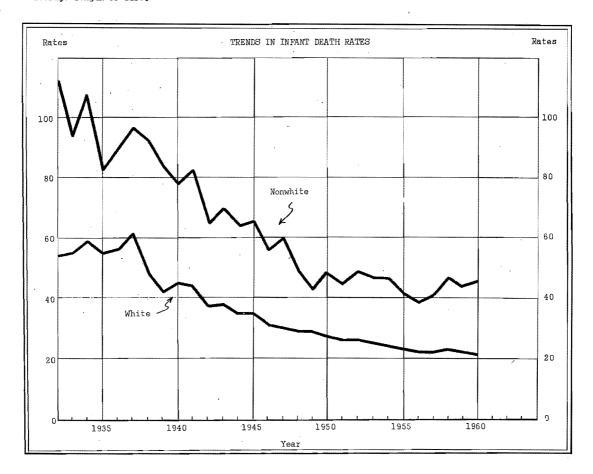

Year2/	White	Nonwhite	Total	Year <u>2</u> /	White	Nonwhite	Total
1932	5.9	10.8	6.1	1947	1.2	2.6	1.3

<sup>1</sup> Rates are per 1,000 live births 2 Recorded 1932-44; Resident 1945-60.

#### TRENDS IN INFANT DEATH RATES BY COLOR: MISSOURI

The color differentiation in the infant death rate shows the nonwhite rate is still higher than the white rate. However, both rates seem to be decreasing at about the same proportion. This decrease in the infant death rate has one of the greatest effects on the aging of the population for the first year of life is the most vulnerable portion of the life cycle, and a decrease in this period adds a larger portion to the total average length of life.

Trends in Infant Death Rates!

			A

<u>Y</u> Rates are per 1,000 live births. <u>Y</u> Recorded 1932-44; Resident 1945-60.

#### TRENDS IN STILLBIRTH RATES BY COLOR: MISSOURI

The color specific stillbirth rates show that the nonwhite stillbirth rate is generally higher than the white stillbirth rate. However, the relative decrease in both rates is approximately the same. One might conclude from this type of rate that the health of the public is still related to its social and economic environment.

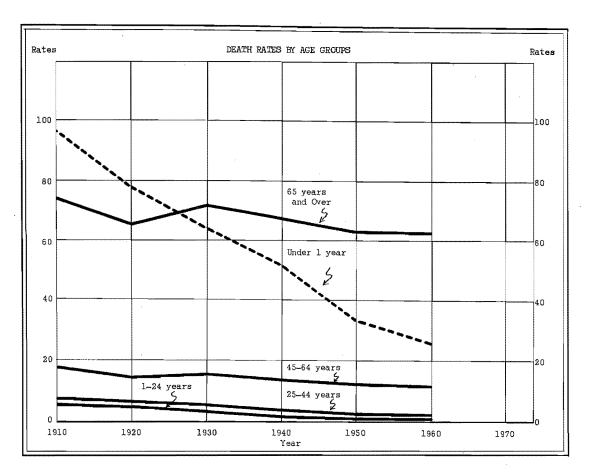

TRENDS IN STILLBIRTH RATES 1/2

### DEATH RATES BY AGE GROUPS: MISSOURI

Although much has been written in regard to the lengthening of life, the accompanying graph seems to indicate that the number of deaths per thousand population has declined very little except in the age group under one year.

Death Rates by Age Groups 1

		All Ages		Age Groups						
Year	Deaths	Avexage	Rate	Under 1	1-24	25-44	45-64	65+		
1911	43,434	43,434.00	13.2	96.7	5.3	7.7	17.7	73.5		
1919 1920 1921	40,040 42,638 37,071	39,916.33	11.7	78.3	4.5	6.7	14.6	65.5		
1929 1930 1931	44,281 43,099 44,120	43,833,33	12,1	64.4	3.1	5.6	16.1	72.3

1949 1950 1951	43,825 43,710 44,123	43,886.00	11.1	33.7	1.0	2.6	12.6	63.4		
1960	48,287	48,287.00	11.2	25.5	0.8	2.2	11.5	62.5		

Source: United States Bureau of the Census, Mortality Statistics, 1911-31, and the annual Vital Statistics of the United States, 1939-1951; 1960, Missouri Division of Health, Vital Statistics Reports;
United States Department of Commerce, Bureau of the Census, 1950 Population Census Report (Missouri), Series P-B25; 1960 Census of Population, Advanced Final Population Count, PC (A-1)-27, December 2, 1960.

Rates are per 1,000 population. Rates are based on census year population figure and a threeyear average of deaths (three years around the census year).

#### DEATHS FROM ACCIDENTS: MISSOURI

Accidental death rates are slowly declining. This is interesting when one considers the general aging of the population and the greater rate of accidental deaths among the aged. During the same period, motor vehicle accidents are slowly rising as a cause of death.

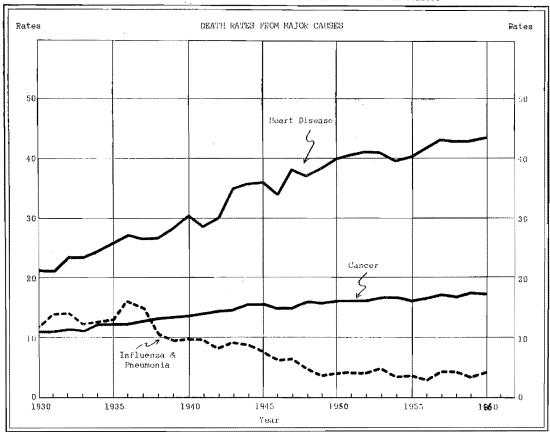

1		Motor Vehicle Accidents

States Bureau of Census Release Series P-25, No. 139, June 27, 1956; 1951-59 as estimated
by the Division of Health: 1960 Census of Population Advanced Final Population Count,
PC (A-1)-27, December 2, 1960.

#### DEATH RATES FROM MAJOR CAUSES: MISSOURI

The death rates for all causes decreased by 14.7 percent between 1911 and 1960. During the same period, the death rates from heart disease increased by 187.4 percent, while the death rates from influenza and pneumonia decreased by 71.2 percent. This change in death rates is due to the control of communicable diseases and better medical care, which in turn effects the aging of the population. This aging is reflected by an increase in the deaths due to chronic diseases such as heart and cancer.

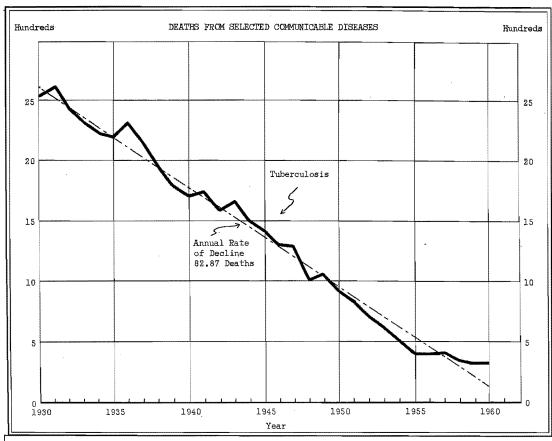

Death Rates From Major Causes 1

Year <i>2]</i>	All Causes	Heart Disease	Cancer	Diseases of Early Infancy	Influenza and Pneumonia	All Accidents	All Othe

#### DEATHS FROM SELECTED COMMUNICABLE DISEASES: MISSOURI

Tuberculosis deaths are declining on the average at the rate of 82 per year. However, since 1955, the rate of decline appears to have leveled off.

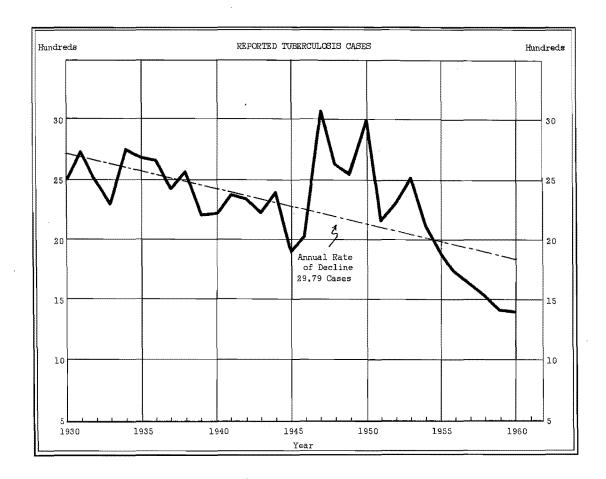

Year <u>l</u>	Brucellosis	Diphtheria	Malaria	Meningococcal Infections	Smallpox	Tuberculosis	Typhoid Fever

#### REPORTED TUBERCULOSIS CASES: MISSOURI

The number of tuberculosis cases are decreasing on the average at the rate of 29 cases per year. This rate is somewhat less than the rate of decrease in regard to tuberculosis deaths, which are decreasing at the average rate of 82 deaths per year. The high peak in the number of cases during the years 1946 through 1953 might be due to a change in emphasis in reporting procedures.

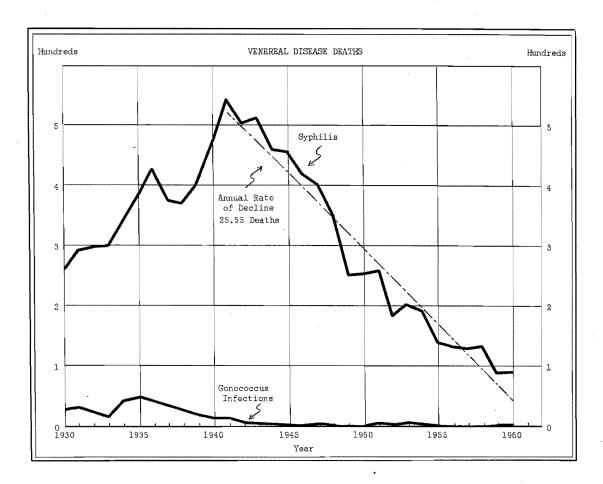

Tuberculosis Cases

Year	Number of Cases Reported	Year	Number of Cases Reported
1930	2,485	1945	1,883
1931	2.740	1946	2,045

#### VENEREAL DISEASE DEATHS: MISSOURI

There is a peak of syphilis deaths during the period 1938 through 1945. If one will examine the number of cases reported during this same period, he can observe a definite peaking in the number of cases. Syphilis is an insidious disease in which a time lag is normally observed between onset and death. It is quite possible that the rise in the number of deaths due to syphilis was due to the new interest in the disease during the peak period surrounding the war years, thus causing this disease to have been mentioned more frequently as a cause of death.

Venereal Disease Deaths

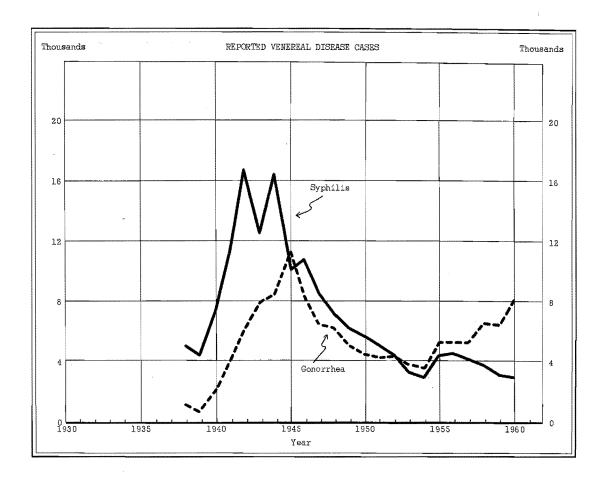

Year1/	Total	Syphilis	Gonococcus Infections	Year <u>l</u> /	Total	Syphilis	Gonococcus Infections

#### VENEREAL DISEASE CASES: MISSOURI

The number of venereal disease cases rose during the period of the second world war. Some of this rise was due to a renewed interest in the reporting of the disease. In 1956, there was another small rise in the number of cases.

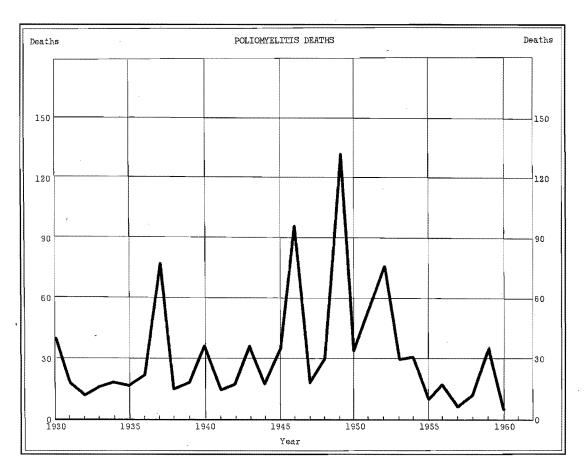

Venereal Disease Cases

Year	Syphilis	Gonorrhea	Total	Year	Syphilis	Gonorrhea	Total

### POLIOMYELITIS DEATHS: MISSOURI

The cyclical phenomenon associated with many diseases can be observed in this graph of polio deaths. In polio, there seems to be a three-year cycle. It is quite possible that a secondary cycle of a longer period of time could account for the rise observed around 1949.

Year1/	All Polio Deaths	Year ¥	All Polic Deaths

#### MARRIAGE AND DIVORCE RATES: MISSOURI

The marriage and divorce rates in Missouri fluctuate very little. There is some indication that the marriage rate is directly related to economic and political conditions such as recession and the threats of war. The marriage rate in turn tends to directly affect the birth rate of the state.

The divorce rates also tend to reflect not only existing economic conditions, but to be effected by the aftermath of conditions that existed in a previous era. When examining marriage and divorce data, one should be cognizant of the fact that the divorces of today are not a direct reflection of the marriages of today; but are, in reality, the termination of marriages that have taken place in a previous time period.
